Research Interests

My research is centered on *Embodied Clinical Intelligence* with the goals of 1) building intelligent assistants that can support clinical workflows and decision-making, 2) architecting multimodal AI systems grounded in clinical context and diagnostic explainability, and 3) establishing the clinician-AI interface for seamless interaction and synergistic collaboration.

Education

UC Berkeley-UCSF, Berkeley & San Francisco, CA 2025–Present

Ph.D. in Bioengineering, Designated Emphasis in Computational Precision Health

Advisors: Yang Yang, Kang Wang, and Jae Ho Sohn

UC Berkeley, Berkeley, CA 2020–2024

B.S. in Electrical Engineering and Computer Sciences (GPA: 3.78/4.00)

Research Experience

Graduate Researcher, Yang Lab, Sohn Lab — UCSF 2025–Present

- Lead the development of EHRGym, a benchmark for training and evaluating autonomous computer-use agents within clinical workflows.
- Lead the development a multi-agent system and an OMOP-compliant environment to evaluate database cohort curation multi-task performance including early pancreatic cancer detection and HCC lesion tracking.
- Direct and coordinate the prospective validation of an EHR-grounded VLM for clinical context-aware Chest X-ray interpretation and vision-language diagnostic explainability model for opportunistic pancreatic cancer screening.

Staff Research Associate, Sohn Lab — UCSF 2024–2025

- Directed a multi-reader clinical study evaluating whether LLM-generated imaging indications, synthesized from clinical notes, improve diagnostic utility compared to referring clinician-provided indications.
- Supervised undergraduate researchers in building a patient-facing vision-language agent for lung cancer screening and developing an automated evaluation metric for patient-centered radiology report communication.

Undergraduate Researcher, Sohn Lab — UCSF 2021–2024

- Led the pipeline development of an open-source, fine-tuned LLM designed to generate radiology report impressions from the radiology report findings and a multi-reader study to assess model performance against radiologists.

Undergraduate Researcher, Data-Intensive Development Lab — UC Berkeley 2020–2021

- Designed geospatial and statistical visualizations (choropleth maps, parity plots) of machine learning-based wealth estimates in Togo, which were featured in a *Nature* cover article.

Work Experience

Software Development Engineering Intern, Amazon Summer 2023

- Developed an observability pipeline for Ring Data Management to attribute infrastructure costs to internal services by aggregating time-series logs into daily and monthly cost estimates.
